

Development Report — GlobalStock

Date: 21 April 2026

Project: GlobalStock — Industrial Equipment E-Commerce Platform

Prepared by: Mohamed

Summary

Full-day development session focused on site navigation polish, trust-building UI components, and the complete authentication experience. Seven major areas were completed: route and button audit, sticky WhatsApp button, promotional top banner, contact page, login page, full admin dashboard, and client profile area.

Work Completed

1. Routes & Buttons — Full Website Audit

Went through every page of the site and fixed broken routes, inconsistent button behaviors, and misaligned CTA destinations. This is the kind of polish work buyers don't consciously notice when it works — but it's the first thing that erodes trust when it doesn't.

- Verified every navigation link, category dropdown, and in-page CTA resolves to the correct route
 - Standardized button variants (primary, ghost, outline) across product cards, page headers, and forms
 - Fixed mismatched hrefs on category navigation and sub-category filter links
 - Ensured cart, wishlist, and account icons behave consistently across all pages
-

2. Sticky WhatsApp Button

Implemented a floating WhatsApp button anchored to the bottom-right of every page. High-value B2B purchases often stall when a buyer has a specific question — a persistent, one-tap shortcut to a live sales contact removes that stall point entirely.

- Floating green circular button, visible on scroll across all pages
 - Deep-links into WhatsApp with a pre-filled message to the sales number
 - Designed to stay out of the way on mobile (bottom-right, above the fold of the footer)
-

3. Top Banner Above the Header

Added a new **TopBar** component that sits above the main header. Used for scrolling trust signals — shipping guarantees, supported countries, warranty coverage, and support availability — these reassurances work best when they're always visible, not buried in the footer.

- Dark banner with a scrolling marquee of trust items
- Rendered site-wide above the header
- Does not interfere with the sticky header when scrolling

4. Contact Page (</contact>)

Built a dedicated contact page with a full inquiry form and direct-contact alternatives. Large equipment purchases often need a human before the sale closes — this page makes it easy to reach the team through whichever channel the buyer prefers.

- Contact form with validation (name, email, phone, subject, message)
- Direct-contact cards: WhatsApp, phone, email — each one click
- Office address, business hours, and map reference
- Same Providers + cart context as the rest of the site, so cart state is preserved if the user navigates back

5. Login Page (</login>)

Built a static authentication page with a split-screen design — dark branded panel on the left, clean form panel on the right. Hardcoded credentials drive two demo roles (client and administrator) that redirect to their respective dashboards on successful login.

- Split layout: dark navy brand panel (with trust items and tagline) + light form panel
- Email + password fields with show/hide password toggle
- Clickable demo account cards that auto-fill credentials for quick testing
- Inline error feedback for wrong credentials
- Role-based redirect after login — client → </account/profile>, admin → </account/admin>
- Custom Rubik typography and a radial-glow visual treatment on the dark panel (no stock header/footer shown on this page)

6. Admin Dashboard (</account/admin>)

Built the full administrator interface, accessible only by admin accounts. Single left sidebar with role-specific navigation, dedicated header bar, and five dashboard sections — modeled on the admin-alAqd dashboard visual language.

- **Tableau de Bord** — four KPI cards (revenue, orders, users, products) with growth indicators, plus a recent-orders table
- **Produits** — searchable, filterable product management table with edit/delete actions
- **Commandes** — orders table with search and status filter
- **Utilisateurs** — user list with roles, registration dates, and account status
- **Paramètres** — site-wide toggles (maintenance mode, promotions, testimonials, wholesale, WhatsApp)
- Full sidebar with initials avatar, role label, logout, and a "Retour à la boutique" shortcut
- Mobile-responsive with a slide-in drawer for the sidebar
- No top-bar, header, or footer from the main site — dedicated admin layout

7. Client Profile Area (</account/profile>)

Built the client-side account area with the same dedicated layout as the admin dashboard but tailored to the customer's needs. Everything a buyer needs to manage their presence on the site is accessible from one place.

- **Mon Profil** — identity card with avatar, name, email, "Client vérifié" badge, join year; plus quick stats grid (phone, member-since, orders, favorites) and a read-only info panel
 - **Mes Commandes** — orders table filtered to the logged-in user's email, with status badges (Livré, Expédié, En attente, Annulé)
 - **Liste de souhaits** — grid of saved products pulled from the live wishlist context
 - **Adresses** — saved addresses with default badge, icon tiles (Domicile / Bureau), edit/delete actions, and an add-address CTA
 - **Paramètres** — password change form (static) and a danger zone for account deletion (static)
 - Same sidebar + header structure as the admin dashboard, with "Client" labels and icons swapped in
 - Role-guarded — admin accounts hitting `/account/profile` are redirected to the admin dashboard, and vice versa
 - Shared account layout wraps both profile and admin with protected-route logic and Rubik typography
-

Notes

All new work is static and front-end-only — no backend integration. Authentication uses hardcoded credentials in `AuthContext`, and all order/product/user data is drawn from a single `mock-data.ts` file. This keeps the implementation ready to swap in real API calls without restructuring the UI layer.
